CHROMATOGRAPHY PRODUCTS CATALOG

Welch Materials, Inc.

HPLC Column, Preparative Column, Flash Column, GC Column,
Packing Materials, SPE, QuEChERS, HPLC Instrument

Quality, Innovation, Competitive Price

Welch Materials develops and manufactures chromatography consumables including HPLC columns, Solid Phase Extraction (SPE) columns, GC columns, sample vials, syringe filters, and chromatographic media.

Welch Materials (Shanghai), Inc. was established in 2003 at Shanghai, China and Welch Materials (Zhejiang) was formed in 2011 at Jinhua, Zhejiang, China. Our core strength was our extensive experience in particle surface modification science and techniques. We are experts in bonding chemistry and innovative packing materials for chromatography applications. By fully utilizing our resources, we have developed many innovative LC and GC consumable products, and in particular, our five series HPLC columns: Ultisil™, Xtimate®, Welchrom®, Topsil® and Boltimate™ series.

Ghost-Buster Column

In HPLC analysis, especially in gradient elution, some unexpected peaks, which are usually called Ghost Peaks, may appear in a chromatogram.

There are several reasons for the appearance of ghost peaks, including residual in injector, water impurities and unknown components in sample. But in general, they are caused by impurities from the mobile phase.

Welch Ghost-Buster column can solve these problems easily!

Welch Ghost-Buster column can efficiently adsorb and remove the impurities from the mobile phase to eliminate their interference to the target peaks.

Installed between the gradient mixer and the sampler, Ghost-Buster column can trap most ghost peaks before HPLC analysis.

Example 1:

Figure 1. Chromatograms without Ghost-Buster column (b) and with Ghost-Buster column (4.6×50 mm) (a)

Column:	Ultisol™ XB-C18, 4.6×250 mm, 5 µm	
Flow Rate:	1.0 ml/min	
Injection Volume:	10 µl	
Detector:	210 nm	
Temperature:	40 °C	
Sample Preparation Solution:	ultrapure water	
Mobile Phase A:	ultrapure water	
Mobile Phase B:	acetonitrile

From Figures 1~3, one can observe that Welch Ghost-Buster column effectively eliminates impurities in the mobile phase.

Ordering Information

Item	P/N	Dimension	Maximum Pressure	Application Equipment
Ghost-Buster Column	06100-31000	4.6×50 mm	40 Mpa	HPLC
Ghost-Buster Column	06100-31001	7.8×50 mm	40 Mpa	HPLC
Ghost-Buster HP Column	06100-31021	2.1×33 mm	100 Mpa	UHPLC
Ghost-Buster HP Column	06100-31025	2.1×50 mm	100 Mpa	UHPLC

Notes:

1. It should be noted that not all impurities can be removed from the mobile phase.
2. Ghost-Buster column is installed between the gradient mixer and the sampler. If it is installed like a guard column, target peaks may disappear.
3. If ion-pairing reagents are used in the analysis, it is possible that the reagents may be retained by the Ghost-Buster column, impacting the analysis' retention time and peak shape.
4. It is not recommended to flush the Ghost-Buster column with 100% water for a long time.
5. Ghost-Buster column's service life differs by analysis conditions, mobile phase and its purity. New column is recommended when result is not ideal.

UltisilTM Bio-UHPLC Column

Why Biocompatible Column?

HPLC column hardware material in most cases is stainless steel, which has strong affinity for bio-materials, including protein, peptides. This affinity leads to undesired adsorption that results in bad peak shape, low sensitivity, and inaccurate analysis.

What Material Is Biocompatible?

PEEK polymer and inert metals, such as titanium alloy, are known to be biocompatible.

The materials of all the parts which contact to liquid and samples should be biocompatible!

Welch Materials is proud to introduce the new PEEK-lined Stainless Steel UHPLC Column for biocompatible applications. This column combines the strength of stainless steel UHPLC column with the chemical inertness of PEEK polymer to ensure bio-sample integrity by minimizing undesired surface interactions while still allowing operations under harsh solvent or pH conditions.

Ultisil™ Bio-UHPLC C4	300 Å	100 m ² /g	2.0-9.0	Yes
Ultisil™ Bio-UHPLC C18	300 Å	100 m ² /g	2.0-9.0	Yes
Ultisil™ Bio-UHPLC SEC*	300 Å	100 m ² /g	2.0-9.0	No

SEC(Size Exclusion Chromatography) packing materials consist of high-purity and stable silica particles bonding hydrophilic polymers.

Dimension (mm)	Particle Size (µm)	Ultisil™ Bio-UHPLC C4	Ultisil™ Bio-UHPLC C18	Ultisil™ Bio-UHPLC SEC
4.6×100	1.8	00216-13639	00201-13639	00237-13639
2.1×100	1.8	00216-13612	00201-13612	00237-13612
2.1×50	1.8	00216-13610	00201-13610	00237-13610

Chromatographic Conditions:

Flow Rate:	0.2 ml/min
Detector:	220 nm
Temperature:	30 °C
Injection Volume:	4.0 µl
Mobile Phase:	water/acetonitrile/TFA=90/10/0.1
Solution Preparation:	dissolve accurately weighed quantities of Phosphoproteins in mobile phase to obtain a solution having concentrations of about 5 mg of each per ml.

Fig. 1. The chromatogram of Phosphoproteins determined by three kinds of XB-C4 column (2.1×50 mm, 1.8 µm, 3.00 Å) a. biocompatible column(peek frit); b. biocompatible column(Ti frit); c. conventional column. The concentration of Phosphoproteins was 5 mg/ml.

According the results shown in Fig. 1c, it can easily be seen that Phosphoproteins failed to elute when using conventional stainless steel columns. Fig 1a and 1b showed that under the same concentration condition. the general trend is that the signal to noise ratio (S/N) obtained with biocompatible column using peek frit is higher than the biocompatible column using Ti frit.

Boltimate™ Core-Shell HPLC Column

Welch Boltimate™ core-shell HPLC column particle has a size of 2.7 μm , and consists of 1.7 μm solid core and 0.5 μm porous layer(porous shell).

This type of column can provide sub-2 μm efficiencies (~200,000 p/m) and high resolution at much lower back pressure. Boltimate core-shell column can be used on both HPLC and UHPLC systems, with straight-forward method optimization process.

Features

- Sub-2 μm efficiencies (~200,000 p/m) and ultra-high resolution at much lower back pressure
- Ultra-fast separation
- Compatible with both HPLC and UHPLC systems
- Narrow particle distribution
- A standard 2 μm inlet frit prevents plugging by dirty samples, suitable for complex sample analysis
- A variety of bonding phases provide choices of different selectivities, while always maintaining excellent peak shape and lot-to-lot reproducibility
- Maximum pressure: 600 bar

With solid core and thin porous surface layer, core-shell particles decrease the diffusion distance of sample molecules, enabling faster mobile phase flow rate leading to increased analytical speed. Compared with traditional porous HPLC columns, Boltimate core-shell column has narrower particle size distribution, resulting in higher column efficiency, higher resolution and lower back pressure.

	D10	D90	D90/D10
5 μm porous silica	3.61	5.22	1.44
3 μm porous silica	2.83	3.98	1.41
1.8 μm porous silica	1.51	2.11	1.40
2.7 μm Boltimate core-shell silica	2.51	2.81	1.12

Theoretical Plate Number and Column Pressure (based on Naphthalene)

Boltimate C18 column efficiency is almost the same as that of 1.8 μm porous C18 column, and two times that of 3 μm porous C18 column. Even with 2X faster flow rate, the pressure of Boltimate is still lower than that of 1.8 μm porous C18 column of the same dimensions under the same analysis conditions, without sacrificing efficiency at the same time.

Column	Theoretical Plates	Column Pressure (bar)	Time
Ultisil™ XB-C18, 3 µm, 2.1×50 mm	5600	85	2.0 min
Ultisil™ UHPLC XB-C18, 1.8 µm, 2.1×50 mm	10500	260	1.8 min
Boltimate™ C18, 2.7 µm, 2.1×50 mm	10100	108	1.5 min
Boltimate™ C18, 2.7 µm, 2.1×50 mm	9500	190	0.8 min

Detection of Ginsenosides:

Ultisil™ Series HPLC Column

Ultisil™ Series HPLC Columns are based on ultra-pure (purity > 99.999%) spherical and totally porous silica, unique bonding chemistry and proprietary surface modification techniques, producing excellent peak shape, column efficiency and exceptional lot-to-lot reproducibility. Ultisil™ column is the best choice for method development, owing to complete bonding chemistries and stable performance.

Features:

- Competitive price
- Ultra-pure spherical porous silica, purity > 99.999%
- Unique bonding chemistry and endcapping technology
- High efficiency: theoretical plate > 80,000/m
- Excellent peak symmetry: tailing factor=0.95~1.05
- Wide pH range: 1.5-10
- Long column lifetime
- Exceptional lot-to-lot reproducibility
- Complete bonding chemistries with different selectivities

Ultisil™ HPLC Column Packing Materials

Pictures below show size uniformity and surface smoothness of the packing particles, characteristics that enable more uniform packing with less channeling effect, resulting in lower back pressure and higher column efficiency. Our silica has a surface area of 320 m²/g with a controlled mean pore size of 120 Å.

SEM Pictures of Ultisil™ Particles

Ultisil™ Pore Size Distribution

Trace Amount Metal Contents Test

A useful chromatographic test of trace amount of metal contents in the column is to compare the peak symmetry of one pair of positional isomers, 4,4'-dipyridyl and 2,2'-dipyridyl, and a neutral chelating reagent, 1,2-dihydroxynaphthalene. 4,4'-dipyridyl, which cannot form chelating complex with metal, is used as a reference. 2,2'-dipyridyl and 1,2-dihydroxynaphthalene, which are chelating reagents, are sensitive to trace amount metal in silica. When a C18 column based on type A silica or other so-called type B silica with higher metal content is used, the peaks of 2,2'-dipyridyl and 1,2-dihydroxynaphthalene would tail or even totally disappear.

Column:	Ultisil™ XB-C18, 4.6 × 150 mm, 5 μm
Mobile Phase:	45% MeOH/55% 20 mM phosphate, pH 7.6
Flow Rate:	1.0 mL/min
Detector:	215 nm
Temperature:	25 °C
Injection Volume:	1 μL
Samples:	1) 4,4'-Dipyridyl 2) 2,2'-Dipyridyl 3) 1,2-Dihydroxynaphthalene

Ultisil™ XB Series HPLC Column

Ultisil™ XB series column is the first series introduced by Welch. This series spans complete bonding chemistries, and provides a variety of selectivities for method development.

- Easy to develop or improve your HPLC method
- Excellent performance, exceptionally rugged USP phases
- Exceptional lot-to-lot reproducibility

Ultisil™ XB-C18—Universal HPLC Analytical Column

Ultisil™ XB-C18 is the most commonly used column in the market. It can substitute Waters Symmetry C18, Agilent Zorbax XDB C18, Phenomenex Luna C18, Supelcosil LC-18-DB, YMC ODS-AM, Alltima C18, GL, Inertsil ODS-2 etc. XB-C18 has high theoretical plates and peak capacity, so it's suitable for analysis of complex samples.

Separation of Basic Compound Antidepressant at pH 7.0

Column:	Ultisil™ XB-C18, 4.6 × 150 mm, 5 µm
Mobile Phase:	20% phosphate, pH 7.0. 80% MeOH
Flow Rate:	1.0 ml/min
Detector:	215 nm
Temperature:	25 °C
Samples:	1) Uracil 2) Ropranolol 3) Ortriptyline 4) Amitriptyline 5) Trimipramine

Comparison of Peak Shape Between Batch to Batch

Column:	Ultisil™ XB-C18, 4.6 × 250 mm, 5 µm
Mobile Phase:	75% MeOH/25% water
Flow Rate:	1.0 ml/min
Detector:	254 nm
Temperature :	25 °C
Samples:	1) Uracil 2) Phenol 3) 4-chloronitrobenzene 4) Methylbenzene

Capacity Factor(k') of Batch to Batch Reproducibility

Analysis of Prednisone Acetate

Column:	Ultisil™ XB-C18, 4.6 ×150 mm, 5 μm
Mobile Phase:	ACN/Water=33:67
Flow Rate:	1.0 ml/min
Detector:	240 nm
Temperature:	30 °C
Injection Volume:	20 μl

Analysis of Aflatoxin

Column:	Ultisil™ XB-C18, 4.6×250 mm, 5 μm
Mobile Phase:	Water:MeOH:ACN=46:40:14
Flow Rate:	1.0 ml/min
Detector:	Excitation wavelength:360 nm Emission wavelength:450 nm Gain:17
Temperature:	30 °C
Derivation Way:	Post -column photo chemical derivation (254 nm)

Aflatoxin B1, B2, G1, G2 mixed standards, meets separation requirements

Tropa Belladonna Spectrogram

Column:	Ultisil™ Special column for Tropa Belladonan, 4.6 ×250 mm, 5 μm
Mobile Phase:	Mobile phase A: MeOH Mobile phase B:0.05% Phosphoric acid solution
Flow Rate:	1.0 ml/min
Detector:	344 nm
Temperature:	30 °C
Injection Volume:	10 μl

Analysis of Donkey-hide Gelatin

Column:	Ultisil™ XB-C18, 4.6 ×250 mm, 5 μm
Mobile Phase:	Mobile phase A: ACN:0.1 mol/l NaAC(pH 6.5)=7:93 Mobile phase B: ACN:water=4:1

Flow Rate:	1.0 ml/min
Temperature:	43 °C
Injection Volume:	5 μl
Reference Samples:	L-hydroxyproline, glycine, alanine, L-proline

Excellent Stability at Low pH and High pH

The stability of XB-C18 is better than other brand columns under pH 1.3 or under pH 10.

Ultisil™ XB-C8----Less retentive than XB-C18

The XB-C8 phase is less retentive than XB-C18 phase, useful for strong hydrophobic compounds that are too strongly retained on C18 phase, and for LC/MS applications, where long retention is not desired. When separating neutral or other highly retained compounds, XB-C8 can save analytical time. However, when separating polar compounds, XB-C8 column provides different selectivity than does XB-C18 column.

Comparison of Retention of XB-C18 and XB-C8

Column:	4.6 × 150 mm, 5 µm
Mobile Phase:	30% water/70% ACN
Flow Rate:	1.0 ml/min
Detector:	344 nm
Temperature:	25 °C

Samples:	1. Uracil 2. Ethylbenzene 3. Propylbenzene 4. Butylbenzene 5. Amylbenzene 6. Heptylbenzene
-----------------	---

Column:	4.6 × 150 mm, 5 µm
Mobile Phase:	20% 20 mM phosphate, pH 7.0, 80% MeOH
Flow Rate:	1.0 ml/min
Detector:	215 nm
Temperature:	25 °C

Samples:	1. Uracil 2. Ropranolol 3. Ortriptyline 4. Amitriptyline 5. Trimipramine
-----------------	--

Analysis of Adefovir Dipivoxil

Column:	Ultisil™ XB-C8, 4.6×250 mm, 5 µm		
Mobile Phase:	Mobile phase A: 0.05 mol/l KH ₂ PO ₄ buffer: ACN=50:50 Mobile phase B: 0.05 mol/l KH ₂ PO ₄		
Gradient Program:	Time[min]	Mobile Phase A	Mobile Phase B

	35	20	80
	40	20	80
Flow Rate:	1.0 ml/min		
Temperature:	40 °C		
Injection Volume:	10 µl		
System suitability solution: Adefovir, Adefovir Monopivoxil, Adefovir Dipivoxil.			

Analysis of Albuterol

Column:	Ultisil™ XB-C8, 4.6×150 mm, 5 µm	
Mobile Phase:	Sodium heptanesulfonate solution(Sodium heptanesulfonate 2.5 g, dilute with water to 1000ml, adjust pH to 3.65 with H ₃ PO ₄):ACN=78:22	
Flow Rate:	1.0 ml/min	
Detector:	220 nm	
Temperature:	30 °C	
Injection Volume:	20 µl	

Analysis of Insulin Detemir

Column:	Ultisil™ XB-C8, 4.6×150 mm, 5 µm	
Mobile Phase:	A: 20 g (NH ₄) ₂ SO ₄ , 900 ml water, 100 ml ACN, adjust pH to 2.3 B: ACN:water=80:20; %B=0[0 min] , 30[9 min], 60[40 min]	
Flow Rate:	1.0 ml/min	
Detector:	214 nm	
Temperature:	30 °C	
Injection Volume:	20 µl	

Ultisil™ XB-Phenyl--- Different selectivity to alkyl phase

Ultisil™ XB-Phenyl phase is less retentive than conventional C18 or C8 phases, but more retentive than standard cyano phase. Due to their ability to participate in n-n interactions, XB-Phenyl columns may actually be more retentive than C18 or C8 columns towards certain polar aromatic compounds, depending on running conditions. The selectivity for highly polar aromatics, which is poorly retained on alkyl-bonded phases, together with reduced retentivity towards non-polar compounds, makes XB-Phenyl an excellent choice for the analysis of complex mixtures of polar and non-polar analytes. Additionally, this bonding phase boasts high surface coverage and exhaustive double end-capping, leading to better performance.

Unique Selectivity for Aromatic Compounds of Ultisil™ XB-Phenyl Phase

Column:	4.6×150 mm, 5 µm
Mobile Phase:	70% MeOH/30% water
Flow Rate:	1.0 mL/min
Detector:	254 nm
Temperature:	24 °C
Samples:	1. Uracil 2. Phenol 3. Paranitrotoluene 4. Toluene

Analysis of Galuteolin in Honeysuckle

Column:	Ultisil™ XB-Phenyl, 4.6×250 mm, 5 µm
Mobile Phase:	A:ACN B:0.5% glacial acetic acid

Ultisil™ XB-C4---Suitable for separation of bio-samples

- Strong retention for hydrophobic and polar compounds
- Column packing of 300 Å big pore size particles is appropriate for separation of peptide and protein samples with sharp peak shape
- Minibore column can be used for LC/MS(/MS)

Column:	Ultisil™ XB-C4(300 Å), 4.6×250 mm, 5 µm	
Mobile Phase:	A: H ₂ O:ACN:TFA=90:10:0.05 B: H ₂ O:ACN:TFA=20:80:0.05 0%-100%B[0-15 min]	
Flow Rate:	1.0 ml/min	
Temperature:	45 °C	
Injection Volume:	10 µl	

Ultisil™ XB-CN---Unique selectivity for polar compounds

Ultisil™ XB-CN column can be used in either reversed or normal phase. Reversed phase CN column has special selectivity for polar compounds, and due to its low hydrophobicity, elution of hydrophobic molecules is fast. Furthermore, XB-CN column shows perfect peak shape for strong basic analytes (including quaternary ammonium salts). Polarity of XB-CN column is the strongest among all reversed columns. It is a good choice for compounds that are strongly retained on standard reversed columns.

Normal phase CN column can replace SiO₂ column. Equilibrium of normal phase column is fast, and the silica surface activity is better than that of silica column. To prolong column life time, alternation between reversed phase and normal phase uses should be avoided. While XB-CN column can be used in either reversed or normal phase, elution sequence is different in different separation mode.

- Can be used in either reversed or normal phases
- Stable bonding chemistry and excellent surface coverage
- Low hydrophobicity, unique selectivity

Analysis of Alogliptin Benzoate

Column:	Ultisil™ XB-CN, 4.6×250 mm, 5 µm	
Mobile Phase:	A: ACN/water/TFA=100/1900/1 B: ACN/water/TFA=1900:100:1

Analysis of Rifampicin Isoniazidand Pyrazinamide

Column:	Ultisil™ XB-CN, 4.6×250 mm, 5 µm
Mobile Phase:	0.01 mol/l Sodium Heptanesulfonate (Sodium Heptanesulfonate 2.0225 g, 1000 ml water, adjust pH to 1.85 with H ₃ PO ₄):ACN=54:46
Flow Rate:	0.6 ml/min
Detector:	254 nm
Temperature:	30 °C
Injection Volume:	20 µl

Ultisil™ XB Series Normal Phase Column

Ultisil™ XB series normal phase columns consist of XB-NH₂, XB-CN, SiO₂ and Diol columns.

Ultisil™ SiO₂ Column

Ultisil™ SiO₂ column uses ultra-high purity type B silica particles with no metal contents. SiO₂ column can separate strong hydrophilic compounds in high concentration organic solvent in normal phase. Good result can be obtained for the analysis of polar compounds which are prone to peak tailing in reversed phase.

Analysis of VD₂

Column:	Ultisil™ SiO ₂ , 4.6×250 mm, 5 µm
Mobile Phase:	Hexane/ IPA = 997/ 3
Flow Rate:	2.0 ml/min
Detector:	254 nm
Temperature:	30 °C
Samples:	1. Facade VD ₂ 2. Internal Standard 3. VD ₂

Analysis of VD₃

Column:	Ultisil™ SiO ₂ , 4.6 ×250 mm, 5 µm
Mobile Phase:	N-hexane:n-amyl alcohol=99.7:0.3
Detector:	254 nm
Temperature:	30 °C
Flow Rate:	2.0 ml/min
Samples:	1. Facade VD ₃ 2. Trans VD3 3. VD ₂

Analysis of VA Acetate

Column:	Ultisil™ SiO ₂ , 4.6 ×250 mm, 5 µm
Mobile Phase:	N-hexane:isopropanol=99.8:0.2
Detector:	326 nm
Temperature:	16 °C
Flow Rate:	1.0 ml/min
Sample is dissolved with n-hexane.	

Analysis of Pesticide Emulsifier Triton-X100

Column:	Ultisil™ SiO ₂ , 4.6 ×250 mm, 5 µm
Mobile Phase:	Ethyl Acetate:EtOH=80:20
Detector:	254 nm
Temperature:	30 °C
Flow Rate:	1.0 ml/min

Ultisil™ XB-NH₂ Column

Ultisil™ XB-NH₂ column is based on propyl-amino silane, mostly used in normal phase, but can also be used in HILIC mode and reversed phase.

- Used in normal phase for weak anion-exchange, and in reversed-phase HPLC for polar compounds
- For applications in aggressive normal phase mode with aqueous eluent
- Vitamins A and D can be separated in the normal-phase mode
- Carbohydrates and sugars can be separated in the reversed-phase mode

Acarbose

Column:	Ultisil™ XB-NH ₂ , 4.6 × 250 mm, 5 µm
Mobile Phase:	Phosphate buffer[KH ₂ PO ₄ 600 mg, ADSP 279 mg, dissolve in 100 ml water and dilute to 1000 ml]: ACN=28:72
Detector:	210 nm
Temperature:	35 °C
Flow Rate:	2.0 ml/min
Injection Volume:	10 µl

Sugars

Column:	Ultisil™ XB-NH ₂ , 4.6 × 250 mm, 5 µm
Mobile Phase:	70% ACN-water solution
Detector:	RID
Temperature:	35 °C
Flow Rate:	0.9 ml/min
Injection Volume:	10 µl
Samples:	Fructose, glucose, maltose, maltotriose, maltpentaose in order

Acetyl-L-carnitine

Column:	Ultisil™ XB-NH ₂ , 4.6 × 250 mm, 5 µm
Mobile Phase:	Buffer:ACN=30:70
Detector:	205 nm 210 nm
Temperature:	20 °C
Flow Rate:	1.0 ml/min
Injection Volume:	10 µl

Welch provides 120 Å and 300 Å pore size packing materials. Please contact Welch or your local distributor for other dimensions.

Ultisil™ Diol Column

Ultisil™ Diol Column is based on ultra-pure porous spherical silica bonded with 1,2-dihydroxypropyl functional group silina. Ultisil™ Diol is used in normal phase mostly, but can also be used in HILIC mode, suitable for separation of peptides, proteins, polar molecules, and organic acids and its polymers.

Like bare silica, Ultisil™ Diol has the ability to form hydrogen bonds and is capable of separating structure isomers. Since most of its surface is covered with organic functions, Ultisil™ Diol absorbs less water, which leads to more reproducible activity. It is also the sorbent of choice when working in normal phase in the presence of water. It has a different selectivity than bare silica gel, and slight modification in the composition of solvent mixture may be necessary to obtain a similar retention.

Ultisil™ Diol column is more stable than traditional normal phase columns, such as NH₂, SiO₂. Compared with NH₂/SiO₂ column, Diol column is not sensitive to water. Ultisil™ Diol column can also be used in reversed phase analysis.

- More stable than traditional normal phase columns, such as Silica, Amine
- Can be used in reversed phase analysis
- Similar polarity to Amine
- Good selectivity without excessive retention
- Improved peak shape compared to bare silica

Tacrolimus

Column:	Ultisil™ Diol, 4.6 × 250 mm, 5 µm
Mobile Phase:	N-hexane:butyl chloride:ACN=7:2:1
Detector:	225 nm
Temperature:	Ambient
Flow Rate:	1.7 ml/min
Injection Volume:	5 µl

Cloprostetol Sodium α, β

Column:	Ultisil™ Diol, 4.6 × 300 mm, 3 µm
Mobile Phase:	N-hexane/isopropanol(v/v)=99.5/0.5
Flow Rate:	1.0 ml/min
Detector:	220 nm
Temperature:	25 °C
Injection Volume:	10 µl

Ultisil™ XB-SAX and XB-SCX Ion Exchange Column

Ultisil™ ion exchange columns are available for both Strong Anion Exchange (SAX) and Strong Cation Exchange (SCX) columns. The SCX/SAX columns are silica based with high resolution and high efficiency. Ultisil™ SAX is a polar bonded phase, consisting of an ammonium-functionalized silane, while Ultisil™ SCX is a classical strong cation exchange, consisting of a covalently bonded aromatic sulfonic acid moiety.

- Organic modifiers such as acetonitrile and methanol may be used with SAX and SCX columns, within organic/buffer solubility constraints
- Retention can be controlled by varying pH, ionic strength and organic modifier content
- Stable pH range from 2.0 to 7.0

13 Heparin Disaccharides

Column:	Ultisil™ XB-SAX, 3.0 ×250 mm, 5 µm
Mobile Phase:	A: weight 0.308 g NaH ₂ PO ₄ to 1000 ml volumetric flask, add 950 ml water to dissolve it, adjust pH with H ₃ PO ₄ to 2.9, then add water to scale mark. B: weight 122 g NaClO ₄ to 1000 ml volumetric flask, add 950 ml mobile phase A to dissolve, adjust pH to 3.0 with H ₃ PO ₄ , then add mobile phase A to scale mark.
Detector:	234 nm, 202 nm
Temperature:	50 °C
Flow Rate:	0.45 ml/min
Injection Volume:	10 µl

Chondroitin Sulfate

Column:	Ultisil™ XB-SAX, 4.6 ×250 mm, 5 µm
Mobile Phase:	A: water, adjust pH to 3.5 with diluted HCl B: 2 mol/l NaCl, adjust pH to 3.5 with diluted HCl
Detector:	232 nm
Temperature:	Ambient
Flow Rate:	1.0 ml/min
Injection Volume:	20 µl
Mixed Standards:	Chondroitin disaccharide(B) 6-sulfated chondroitin disaccharide(C) 4-sulfated chondroitin disaccharide(A)

Leonurus Granule

Column:	Ultisil™ XB-SCX, 4.6 ×150 mm, 5 µm
Mobile Phase:	ACN:0.05 mol/L KH ₂ PO ₄ :H ₃ PO ₄ =15:85:0.15
Detector:	192 nm
Temperature:	Ambient
Flow Rate:	1.0 ml/min
Injection Volume:	10 µl

Melamine

Column:	Ultisil™ XB-SCX, 4.6 ×250 mm, 5 µm
Mobile Phase:	0.05M KH ₂ PO ₄ (adjust pH to 4.7 with H ₃ PO ₄):ACN=70:30
Detector:	240 nm
Temperature:	25 °C
Flow Rate:	1.5 ml/min
Injection Volume:	20 µl

Metformin HCL

Column:	Ultisil™ XB-SCX, 4.6 ×250 mm, 5 µm
Mobile Phase:	1.7% NH ₄ H ₂ PO ₄ (adjust pH to 3.0 with H ₃ PO ₄)
Detector:	218 nm
Temperature:	Ambient
Flow Rate:	1.0 ml/min
Injection Volume:	10 µl
Samples In Order:	Icyandiamide, Melamine, Metformin HCL

Domiphen Bromide Buccal Tablets

Column:	Ultisil™ XB-SCX, 4.6 ×250 mm, 5 µm
Mobile Phase:	MeOH:0.05 mol/l NaAC=80:20
Detector:	274 nm
Temperature:	Ambient
Flow Rate:	1.0 ml/min
Injection Volume:	100 µl

Welch provides 120 Å, 300 Å pore size packing materials. Please contact Welch or your local distributor for other dimensions.

Ultisil™ AQ-C18----The most widely used column in food industry

Ultisil™ AQ-C18 columns are designed to have extended retention and selectivity for hydrophilic and polar compounds, which are poorly or not at all retained on other phases. A proprietary bonding chemistry, Ultisil™ AQ-C18 avoids so-called "phase collapse", even when 100% water is used, a phenomenon that conventional C18 columns typically exhibit at high water content in the mobile phase. Ultisil™ AQ-C18 phase is fully end-capped to ensure the best peak shapes of polar and basic compounds and longer lifetime. Typical applications are separations of water soluble compounds that cannot be retained on traditional C18 phase. Examples include biomolecules, metabolites, and pharmaceutical degradants such as organic acids, water-soluble vitamins, oligosaccharides, amino acids, and small peptides and nucleotides.

Features:

- No phase collapse, suitable for high aqueous mobile phase
- Less retentive than XB-C18 for non-polar compounds
- Increased retention for polar and water soluble compounds
- Carbon loading: 12%, pore size: 120 Å, particle size: 3 µm, 5 µm, 10 µm

Phase Collapse Research

Column:	Ultisil™ AQ-C18, 4.6 ×100 mm, 5 µm
Mobile Phase:	10% ACN/90% 50 mM phosphate, pH 3.5
Detector:	215 nm
Temperature:	25 °C
Flow Rate:	1.0 ml/min
Samples:	1. Theophylline 2. Caffeine 3. Phenol

Phase Collapse Comparison with Other Brands

Peak shape is excellent for acid, basic and neutral samples on AQ-C18. When in highly aqueous mobile phase, retention for polar compounds such as organic acids, peptides, nucleosides and water soluble vitamins is strong. Under the same condition, when compared with other brands in highly aqueous mobile phase, Ultisil™ AQ-C18 shows excellent resistance to phase collapse.

Column:	Ultisil™ AQ-C18, 4.6 × 100 mm, 5 µm
Mobile Phase:	50 mM phosphate, pH2.5
Detector:	210 nm
Temperature:	25 °C
Flow Rate:	1.0 ml/min
Samples:	1. Oxalic acid 2. Lactic acid 3. Maleic acid 4. Citric acid 5. Fumaric acid 6. Succinic acid

How to Choose XB-C18 or AQ-C18?

XB-C18	AQ-C18
<ul style="list-style-type: none"> • Suitable for separation of most pharmaceuticals, environment and chemical compounds • Excellent peak shape for basic and polar samples 	<ul style="list-style-type: none"> • Suitable for water soluble strong polar samples, such as traditional Chinese medicine ingredients, food, beverage, organic acids, peptides, nucleosides and water solution vitamins • Best choice for mobile phase that contains <20% organic content

Ultisil™ LP Series HPLC Column

LP is abbreviation for Low pH. LP phases are designed for use at low pH conditions. LP phase consists of two very bulky hydrophobic protective groups to prevent siloxane bond from hydrolysis at low pH condition. So Ultisil™ LP column is extremely stable in very low pH mobile phase and at high temperature, even at the lowest pH of 1.0, making it the most stable C18 for low pH application in the market. Because it is not endcapped and has more surface silanols, LP phase has more retention for some early eluted polar compounds, and provides different selectivities than does traditional C18. Ultisil™ LP-C18 is the most polar C18 among all the C18 products of Welch.

- Not endcapped, prevents siloxane bond from hydrolysis at low pH condition.
- Compatible with 100% water as the mobile phase, more polar than "AQ", better peak shape and resolution
- Best peak shape for polar compounds
- Exceptional lifetime at low pH (0.5-8.0) and high temperature
- 300 Å LP-C18 is exclusively used for separation of polypeptide and protein

When pH<5.0, based on your separation conditions, you may choose either LP-C18 or XB-C18;
When pH<2.0 (such as 0.1%TFA), LP-C18, which provides exceptional stability, longer lifetime, perfect peak shape and superior selectivity, is your best choice

Ultisil™ ALK-C18 HPLC Column

Ultisil™ ALK-C18 is a new generation of C18 column introduced by Welch. In this column, hydrophilic groups are bonded into the silica surface, where large number of silanol groups are replaced, reducing the interactions between basic samples and the silanol groups. As a consequence, the selectivity of ALK-C18 is different from that of traditional C18.

Features:

- Mixed solid phase with both hydrophobic and electrostatic interactions
- Excellent peak shape for basic compounds
- Fast separation of similar samples on a column

USP listing: L1
pH Range: 1.5-10.0
Surface Area: 320 m²/g

Ultisil™ Polar Embedded HPLC Column

Ultisil™ polar embedded phases have been developed for more than 10 years. Earlier polar embedded phase is developed with amide phase. The polar functional group close to the surface increases the wettability of this phase, thus decreasing phase collapse, making this phase compatible with mobile phase of up to 95% water content. The polar functional group also shields the effects of unreacted silanol groups, providing excellent peak shape for very polar and strong basic compounds and different selectivity than does C18 phase. Welch provides two kinds of packing materials - Ultisil™ Polar-RP and Ultisil™ Phenyl-Ether.

Ultisil™ Polar-RP HPLC Column

- Excellent with mobile phase of 100% water content, even better than AQ-C18
- Different selectivity than that of AQ-C18
- Excellent peak shape for acidic and basic compounds owing to the "shield" effect of polar linkage to silanol activity by forming hydrogen bonding
- Retentive for polar compounds. Uracil, which can't be retained on most reversed phase columns at 100% water, can be retained on this column, and eluted after 5-fluorocytosine and cytosine. Note that the analysis of purine, pyrimidine, small molecular acids, catecholamine and water soluble vitamins all requires mobile phase with high water content
- Fast separation of similar samples on a column

Comparison of separation of acid compounds

Comparison of separation of base compound

Analysis of Cefradine

Column:	Ultisil™ Polar RP, 4.6 × 250 mm, 5 µm
Mobile Phase:	MeOH:water:3.86% NaAc:4%HAC=400:1564:30:6
Detector:	254 nm 220 nm

Samples:	Impurity reference solution 220 nm 7-ADCA: 3.696 min Dihydrophenylglycine: 4.128 min Cefalexin: 9.459 min Cefradine: 13.238 min

Ultisil™ Phenyl-Ether HPLC Column

- Improved polar & aromatic reversed phases selectivity that complements the more conventional C18 column chemistries
- Better selectivity than phenyl phase for separation of nitrobenzene isomers
- Improved peak shape of highly acidic polar compounds, and different selectivity from other polar phases such as polar embedded phase
- Compatible with 100% water mobile phase

Analysis of Ephedra

Column:	Ultisil™ Phenyl-Ether, 4.6 × 250 mm, 5 µm
Mobile Phase:	MeOH:0.092%H ₃ PO ₄ solution[contain 0.04% trimethylamine and 0.02% n-butylamine]=1.5:98.5

Ultisil™ UHPLC Column

Welch also offers Ultisil™ UHPLC (1.8 µm) columns. With high column efficiency and good lot-to-lot reproducibility, Ultisil™ UHPLC can generate high quality data, decreasing the probability of repeated sample analyses while reducing the consumption of solvent at the same time. Ultisil™ UHPLC series offer a variety of bonded phases, specified guard columns and pre-columns for the users to design and realize faster and more environmentally friendly chromatography applications with higher resolution.

Ultra Resolution: same resolution as or better than that of conventional column which has more packing materials

Ultra speed: UHPLC offers more information per unit time and higher speed owing to its smaller particles.

Sensitivity: higher N, narrower peak width (W), higher peak height. The system sensitivity of 1.8 µm UHPLC is 70% and 40% higher than that of conventional column of 5µm and 3.5 µm packings, respectively.

Hardware Features:

- New design
- Low dead volume
- New special frit

Packing Materials Features:

- High efficiency 1.8 µm particles
- High column efficiency and excellent strength
- Variety of bonding chemistries
- Stable column bed, highest pressure: 15,000 psi

Column Packing Features:

- Unique column packing technique
- Withstand ultra-high pressure of UHPLC instruments

Ultisil™ PAH Column

Ultisil™ PAH Column is a special column recently designed by Welch for the separation of PAHs in EPA method 610. PAHs (Polycyclic Aromatic Hydrocarbon) are hydrocarbons with two or more benzene rings, and considered major pollutants. Therefore the analysis of these potentially carcinogenic compounds in water, air, soil and food takes high priority. Most of PAHs do not exist alone. Substances that may contain PAHs include charcoal, crude oil, creosote, tar, dyes, plastic, rubber, pesticide, lube, release agent, electrolyte, mineral oil, pitch, insecticide, and bactericide, etc.

16 PAHs:

Naphthalene	Benz[a]anthracene
Acenaphthylene	Chrysene
Acenaphthene	Benz[b]fluoranthene
Fluorene	Benz[k]fluoranthene
Phenanthrene	Benz[a]pyrene
Anthracene	Indeno[1,2,3-cd]pyrene
Fluoranthene	Dibenzo[a,h]anthracene
Pyrene	Benz[g,h]perylene

Ultisil™ PAH columns can separate all 16 PAHS in EPA method 610 rapidly (in less than 30 min) with high resolution. Ultisil™ PAH columns are silica based columns for PAH analysis with the best peak shape.

Analysis of 9 Pesticide Residues in Water

Ultisil™ Amino Acid HPLC Column

Welch Ultisil™ Amino Acid HPLC columns are made from spherical, totally porous, and ultra-high purity (>99.999%) type B silica particles. Welch's proprietary technique of surface modification before bonding generates a very smooth and uniform surface with less acidic surface silanol. Ultisil™ Amino Acid columns provide the best performance in peak shape, efficiency and resolution for the analysis of 18 amino acids. Complete sample preparation can be achieved in as little as 30 min.

Ultisil™ Amino Acid Method Package

- Ultisil™ Amino Acid Column (5 µm, 4.6×250 mm), 1 pk
- Amino Acid Standards, 2 bottles. 1 ml/bottle
- Derivatization reagent A
- Derivatization reagent B
- Ultisil™ AA method brochure

Ultisil™ C30 HPLC Column

Carotenoids is a broad class of natural products, of which over 600 types have been found so far, including compounds of different carbon chain length, such as C40, C50 and C30 etc. They are well known to have many biological functions, including cancer prevention and treatment functions.

Compared to classical C18 stationary phases, the C30 phase is much more hydrophobic and retaining. Even when pure organic eluent is applied, many sample solutes, such as carotenoids, are able to retain. Ultisil™ C30 is designed for the separation of geometric isomers, polar carotenes, polar and nonpolar xanthophylls, steroids, retinols and fat-soluble vitamins (A, D, K and E).

- Polymeric C30 alkyl chains
- High lipophilic
- Exceptional selectivity pattern for geometric isomers
- pH range: 1.5-10

Separation of Carotenoids

Ultisil™ Fluorinated Phase HPLC Column

Ultisil™ Fluorinated Phase has high selectivity and increased retention toward closely related compounds, including both aromatic fluorinated compounds and other nonaromatic halogenated compounds. It can be used in reversed phase and provides an alternative and complementary separation to that performed on C8 or C18 columns for many analytes. Fluorinated phase has better separation for ionic and polar compounds than do alkyl phases. Fluorinated phase can provide different elution orders, leading to enhanced selectivity for compounds that are difficult to separate.

Ultisil™ PFP HPLC Column

Ultisil™ PF-Phenyl is a phase primarily used in the separation of molecules bearing fluorine atoms, but may also be in the separation of non-fluorinated compounds such as Taxol and its derivatives. Because of its phenyl ring, it has a higher selectivity for aromatic molecules than for other alkyl-fluorinated phases. Ultisil™ PF-Phenyl can separate nitro-benzene isomers (para vs. ortho), which cannot be separated by conventional phenyl phase.

Analysis of Taxol

Ultisil™ Mixed Mode Phase

Ultisil™ Mixed mode phase, whose selectivity is totally different from conventional reversed phase, is a new packing material that is the development trend of liquid chromatography. There are three modes in the mixed mode phase: reversed phase/anion exchange, reversed phase/cation exchange, reversed phase/amphoteric compound.

- Different selectivity from reversed phase/anion exchange column
- Can separate strong polar compounds without using ion-pair agent
- Separate positive compounds, negative compounds and neutral compounds simultaneously
- Appropriate for MS analysis

Ultisil™ MM C18/SCX

- Ultra-pure spherical porous silica
- Can be used for separation of hydrophobic and ion compounds
- Best choice for analysis of unknown samples, especially metabolites
- The first mixed column in China

Analysis of Melamine

Column:	Ultisil™ MM C18/SCX, 4.6 × 250 mm, 5 µm
Mobile Phase:	0.01 M NH ₄ ACl(pH3.0):ACN=62:38
Detector:	240 nm
Temperature:	40 °C
Flow Rate:	1.0 ml/min
Injection Volume:	20 µl

Ultisil™ MM NH₂/CN

- Hilic Mode
- Base on ultra-pure spherical porous silica
- Appropriate for analysis of sugars that are hard to separate

Separation of Lactose and Galactose

Column:	Ultisil™ MM NH ₂ /CN, 4.6 × 250 mm, 5 µm
Mobile Phase:	ACN:water =70:30
Detector:	RID (40 °C)
Temperature:	45 °C

Ultisil™ HILIC Column

HILIC(Hydrophilic Interaction Liquid Chromatography) is a separation mode achieved through the partitioning of polar solutes from high concentration, water-miscible, organic mobile phase into hydrophilic surface environment.

Ultisil™ HILIC Amide

Ultisil™ HILIC Amide column is a special column designed for HILIC mode. As amide group has strong hydrophilicity, stability and electrically neutral, Ultisil™ Amide has longer life, better separation repeatability and peak shape than NH₂ phase does.

- Based on silica bonded with amide groups, appropriate for the separation of hydrophilic samples
- Multiple actions such as hydrogen bond, molecular and electrostatic interactions
- Good compatibility with many kinds of detectors, such as MS detector
- Stable in organic mobile phase that contains water

Fructo-oligos

Column:	Ultisil™ HILIC Amide, 4.6 ×250 mm, 5 μm
Mobile Phase:	ACN:water =70:30
Detector:	RID (40 °C)
Temperature:	40 °C
Flow Rate:	1.0 ml/min
Injection Volume:	20 μl
Mixed Standards:	Sucrose, kestose, nystose, megazyme, 1F-Fructofuranosyl nystose)

Ultisil™ Chiral Column

Ultisil™ Chiral Columns are based on spherical silica particles coated with chiral polymers (amylose derivatives or cellulose derivatives). Welch offers 5 µm and 10 µm particles, and four types of chiral columns: Cellu-D, Cellu-J, Amy-D and Amy-S. 80% of all racemic compounds can be separated by these four chiral columns.

Cellu-D/Cellu-DR:

Cellulose tris [3,5-dimethylphenylcarbamate] coated silica

Cellu-J/Cellu-JR:

Cellu-J/Cellu-JR: Cellulose tris [4-methyl benzoate] coated silica

Amy-D/Amy-DR:

Amylose tris [3,5-dimethylphenylcarbamate] coated silica

Amy-S/Amy-SR:

Amylose tris [(S)- α -methylphenyl carbamate] coated Silica

Fenamiphos

Xtimate® Series HPLC Column

---Next generation beyond mid-range Ultisil™ series

X features of Xtimate® column

eXtra pH range: wide pH range from 1.0 to 12.5, excellent peak shape for strong bases

eXtra column lifetime: 5 times of similar product such as Gemini

eXtra performance: column efficiency of 5 µm columns is as high as 90,000/m, 2-3 times of that of Xterra

eXtra care from Welch: enjoy excellent pre-sales and after-sales service from Welch

Xtimate® Silica Based HPLC Column

Xtimate® HPLC column derives its outstanding performance from a special hybrid particle based technique, which coats a unique 5 nm organic/inorganic polymer layer on the silica surface, so that the pH range is extended to 1.0-12.5.

Xtimate® column is designed for HPLC method development. Regardless of the types of mobile phase or high temperature, Xtimate® HPLC column always has stable performance and long lifetime.

Hybrid Particles Based Xtimate® Technology

Comparison of Peak Shape After Soaking In Base

Column:	Xtimate® C18, 5 µm, 150 x 4.6 mm
Mobile Phase:	CH ₃ CN/0.01N NaOHaq.(pH=12)=30/70
Flow Rate:	1.0 mL/min
Temperature:	40 °C
Soak Time:	4 hours

Column:	Ultisil™ C18, 5 µm, 150 x 4.6 mm
Mobile Phase:	CH ₃ OH/H ₂ O=60/40
Flow Rate:	1.0 mL/min
Temperature:	40 °C
Detector:	UV 254 nm
Samples:	1.Uracil 2.Methyl benzoate 3.Toluence 4.Naphthalene

After test at pH 12 condition for 4h, the peak shape of hybrid particles based Xtimate® column shows little difference.

Lifetime Test Comparison: 5 Times Longer Than Gemini

Column:	Xtimate® C18, 5 µm, 150x4.6 mm / Gemini C18, 5 µm, 150x4.6 mm
Mobile Phase:	A: 10 mM Ammonium Bicarbonate pH 10.5 B: 90:10 Acetonitrile/buffer
Gradient Program:	0% to 100% B in 10 min. 100% B for 7 min. 0% B for 3 min.
Flow Rate:	1.0 ml/min
Temperature:	50 °C
Detector:	UV 254 nm
Samples:	1.Uracil 2.Methyl benzoate 3.Toluence 4.Naphthalene

Unprecedented Peak Shape

At mid pH, strong bases usually exhibit bad tailing due to secondary interactions between the analytes and the surface silanols. In Welch's unique technique, the hybrid layer totally covers the surface silanols and blocks analytes' access to these surface silanols. Improved bonding and endcapping further reduce silanol activity. As a result, hybrid particle based Xtimate® columns show unprecedented peak.

The detection of amitriptyline by poor endcapping product

The detection of Amitriptyline by Symmetry C18

The detection of amitriptyline by Xtimate® C18

Xtimate® HPLC Column Bonded Phases

Besides C18 and C8 bonded phases, Xtimate also provides C4, CN, Phenyl bonded phases. Xtimate® applies a new special Smoothpak™ technique to C18, C8, C4, CN, Phenyl and amino phases, different than the bonding method of other series. As a result, Xtimate® provides a different selectivity, improved stability and reproducibility. In particular, for the Phenyl phase of Phenyl-Hexyl, Xtimate® is totally different from Ultisil™ Phenyl. Xtimate® Phenyl phase's longer hexyl group provides extra hydrocarbon interaction and longer retention than conventional phenyl-propyl phase; it also provides better chemical stability. Welch also adds polar embedded phase, Polar-RP on Xtimate® particles, to further improve peak shape for very polar and strong basic compounds and provides different selectivity than does C18 phase.

Solifenacin Succinate

Column:	Xtimate® C18, 5 µm, 250 x 4.6 mm
Mobile Phase:	50 mmol/l K ₂ HPO ₄ (pH3.0):ACN=60:40

Xtimate® SEC

Xtimate® SEC (size exclusion chromatography), also known as “global protein hydrophilic modified silica column”, is made from ultra-high purity, stable silica bonded with hydrophilic polymer and diol functional groups. This double bonding mechanism, which makes possible of nonspecific adsorption of high Mw polymers, proteins, biological enzymes, polypeptides and other biological samples, can be applied to separating water-soluble polymers from biomacromolecules.

- Ultra-high purity, stable silica bonded with hydrophilic polymer and diol functional groups.
- 5 μm or 3 μm silica microsphere, high separation efficiency
- 120 Å minibore columns fit for analysis of polar compounds such as cephalosporins; 300 Å ones fit for biomacromolecules such as proteins and polypeptides.
- Four pore sizes: 120 Å, 300 Å, 500 Å and 1000 Å.

Xtimate® Polymer Based Column

Xtimate® Sugar-H is a special column designed for Ribavirin. Packed with H⁺ modified low-linking polystyrene-divinybenzene spheres (PS-DVB), this column can be applied for the analysis of organic acids and mixed alcohols.

Xtimate® Sugar-Ca is a strong cation exchange column packed with Ca²⁺ modified PS-DVB resins; can be used for the analysis of sugar products.

Xtimate® PS/DVB is based on polystyrene-divinybenzene. This column can be used in extreme conditions (pH 1-14).

Xtimate® G-10 glucan gel chromatographic column, which uses Sephadex G-10 glucan gel from GE Healthcare, is a special column developed for the analysis of ceftazidime, ceftriaxone sodium, cefoperazone sodium, cefotaxime sodium and any other Cephalosporins polymers.

Separation of Organic Acids

Column:	Xtimate® Sugar-H, 5 µm, 300 x 7.8 mm

Topsil® Series HPLC Column

Topsil® series HPLC column is a next-generation column by Welch, besides Ultisil™, Xtimate® and Welchrom®. This series uses different silica and provides different selectivity.

Features:

- High purity silica (99.99%) with 150 Å pore size and 250 m²/g surface area
- 12% carbon loading for C18 phase
- Because of large pore and moderate carbon loading, Topsil® C18 phase can also be used as AQ-C18 without phase collapse
- Endcapped for excellent peak shape and lifetime
- Lower back pressure than Ultisil™, almost the same column efficiency as Ultisil™
- Good for small molecules and peptides
- Topsil phases including C18, C8, Phenyl-Hexyl, Silica, NH₂ and CN

Epigaeal Srephaia Root

Column:	Topsil® C18, 250 x 4.6 mm, 5 µm	
Mobile Phase:	25 mM NaAC buffer(2% trimethylamine, adjust pH to 3.50 with HAC)	
Flow Rate:	1.5 ml/min	
Temperature:	40 °C	
Detector:	280 nm	
Injection Volume:	20 µl	

Ketoprofen

Column:	Topsil® C18, 150 x 4.6 mm, 5 µm
Mobile Phase:	Phosphate buffer (68 g KH ₂ PO ₄ dissolve in 1000 ml water, adjust pH to 3.5 with H ₃ PO ₄)
Flow Rate:	1.0 ml/min
Temperature:	30 °C
Detector:	233 nm
Injection Volume:	20 µl

Vitamin D3

Column:	Topsil® Silica, 250 x 4.6 mm, 5 µm
Mobile Phase:	N-hexane:n-amyl alcohol=99.7:0.3
Flow Rate:	2.0 ml/min
Temperature:	30 °C
Detector:	254 nm
Injection Volume:	20 µl

Sex Hormone in Cosmetics

Column:	Topsil® Phenyl-Hexyl, 250 x 4.6 mm, 5 µm
Mobile Phase:	MeOH:H ₂ O=60:40
Flow Rate:	1.0 ml/min
Temperature:	30 °C
Detector:	210 nm, 254 nm
Injection Volume:	20 µl
Mixed Standards:	Estrogen: estradiol, oestrone, estrostilben, estriol Androgen: testosterone, methyltestosterone Progestational hormone:progesterone

Welchrom® Series HPLC Column

--- Combination of perfect peak shape and lowest back pressure

- Perfect peak shape and low back pressure
- Ultra-high purity(>99.999%) Type B silica particles
- New bonding and endcapping technique
- Economically priced

Comparison with Other Brands

Brands	Tailing factor(lamitriptyline)	Back pressure(Methanol/H ₂ O)=75/25

Preparative HPLC Column

How to Choose a Preparative Column?

Step1: select the column packing

Welch provides all types of packing materials, the detail of which is shown in the packing materials part

Choose pore size according to molecular weight					
Molecular Weight	< 800	< 2000	< 10,000	< 50,000	< 250,000
Pore Size	60 Å	120 Å	200 Å	300 Å	1000 Å
Choose proper particle size according to stress tolerance					
Pressure	90 bar	40 bar	20 bar	6 bar	4 bar
Particle Size	5 µm	10 µm	15 µm	20-40 µm	40-70 µm

Step2: select particle size, pore size to achieve good recovery according to the sample properties

C18, C8, C4 are the most universal bonding phases to separate proteins, peptides.

Bonding Phase		Pore Size	C18	C8	C4	Molecular Weight
			Slow ←	Retention time	→ Fast	
			High ←	Plate number	→ Low	
High	High	120 Å	◆	→	◇	≤ 5000
Plate Number	Column Pressure	200 Å	◇	←	◆	5000-20,000
Low	Low	300 Å	◇	←	◇	20,000-100,000

◆ Most appropriate ◇ Appropriate.

Step 3: choose preparative columns based on mass loading and sample property

Mass Loading	Particle Size µm Diameter mm	Column Efficiency				
		5 N=90,000	10 N=40,000	10/20 N=20,000	15/30 N=10,000	50 N=5,000
Test	4.6	▲	▲	▲	▲	▲
10-50mg	10	★	◆	▲	▲	▲
	20	★	★	▲	▲	▲
50-100mg	30	◆	★	◆	▲	▲
0.1-1g	50	▲	★	★	▲	▲
1-10g	100		▲	★	◆	▲
	150		▲	★	◆	▲
10-100g	200				◆	★
≥ 100g	≥ 300				▲	★

★: Most appropriate ◆: Appropriate ▲: According to the purpose

Step 4: determine flow rate, mass loading, start experiment

$$\text{Scale-up factor} = \frac{(\text{Diameter prep})^2}{(\text{Diameter anal})^2} \times \frac{\text{Length prep}}{\text{Length analytical}}$$

Consider scaling up from a 4.6×250 mm column to a 10×250 mm column:

$$\text{Scale-up factor} = \frac{(10)^2}{(4.6)^2} \times \frac{250}{250} = 4.73$$

Flow rate:

$$\text{Flow rate(perp)} = \text{Flow rate(anal)} \times \frac{(\text{Diameter prep})^2}{(\text{Diameter anal})^2}$$

Consider 4.6 mm analytical column where flow rate = 1 ml/min. On 10 mm prep column, the flow rate = $1 \times \frac{(10)^2}{(4.6)^2} \approx 4.7 \text{ ml/min}$

This calculated flow rate may be used for the larger column to ensure the same linear velocity of mobile phases as used in the analytical run. However, reasonable flow rates are based on column diameters. Systems will be limited by increasing backpressure with increasing column length and decreasing particle size.

Mass loading Approximate Mass Loading Capacity

Items	Diameter				
	4.6×250 mm	10×250 mm	21.2×250 mm	30×250 mm	50×250 mm
Packing Amount(g)	3	13	60	110	350
Scale-up Factor	1	4.73	21.2	42.5	118
Mass Loading(mg)	0.03-3	0.15-13	0.6-60	1.1-110	3-350
Flow Rate Range(ml/min)	0.5-2	3-9	14-40	28-85	80-250

Preparative Column

Preparative Column uses the same packing materials as does analytical column, to ensure the best reproducibility of analysis and preparative scale. Special packing technique and stainless modular column tube ensure the stability of column bed. The theoretical plate number for 10 μm column is greater than 35000/m; for 5 μm column, it is greater than 75000/m, and the peak symmetry is around 0.95~1.20.

Better Column Efficiency and Tailing

Column	Ultisil™ XB-C18, 250 x 10 mm, 5 μm
Mobile Phase	75% MeOH
Flow Rate	3.0 ml/min
Detector	254 nm

Samples	Retention time[min]	Half Peak Width[min]	Theoretical Plate Number	R	Tailing Factor
Uracil	3.8647	0.0713	16261	0.00	1.18
Phenol	5.3187	0.0933	17990	10.40	1.19
4-nitrobenzene chloride	9.4197	0.1537	20817	19.55	1.11
Methylbenzene	13.6573	0.2210	21157	13.32	1.07

Better Separation Efficiency, Easier for Linear Amplification

Generally, research is done on the analytical column at first. Then the same packing materials is used, to ensure the stability during linear amplification.

Perfect Separation with Different Dimensions

Column	Ultisil™ XB-C18, 250 x 10 mm, 5 µm
Flow Rate	1.0 ml/min
Sample Loading	0.5 mg

Column	Ultisil™ XB-C18, 250 x 20 mm, 5 µm
Flow Rate	20 ml/min
Sample Loading	100 mg

Column	Ultisil™ XB-C18, 250 x 50 mm, 5 µm
Flow Rate	118 ml/min
Sample Loading	2000 mg

Ultisil™ 5 µm Preparative Column Ordering Information

Ultisil™ series also provides 10 µm packing materials.

Flash Column—Low Pressure Preparative Column

Flash column chromatography is a quick and (usually) easy way to separate complex mixtures of compounds. It is widely applied to organic compounds, natural products, biomacromolecule and any other active substances.

Features of WelFlash

- Homogeneous particle and pore size, special bonding technique from Welch
- Perfect result reproducibility, best performance
- All types of packing materials and specifications
- Polypropylene tube and joint to tolerate the column pressure of fast chromatography
- Provide abundant applications
- Easy operation, low cost, fast separation and low back pressure

Packing Materials of WelFlash

		Particle Size (μm)	Pore Size (\AA)	Surface Area (m^2/g)	Description
Amorphous spherical silica	WelFlash™ SiO ₂ -II	-	60	-	Normal phase; separates weak polar compound while using weak polar mobile phase.
	WelFlash™ C18-II	-	60	-	Reversed phase; the most universal packing material.
	WelFlash™ SiO ₂	20-40 40-70	120	480	Considered the most polar normal phase sorbent available, Highly polar sorbent to retain polar compounds from nonpolar matrices.
	WelFlash™ C18	20-40 40-70	120	480	The most popular C18 sorbent.
	WelFlash™ Phenyl	20-40 40-70	120	480	Similar polarity to C8; Additional polar secondary n-n interactions enhance retention of aromatic compounds.
Spherical silica	WelFlash™ CN	20-40 40-70	120	480	Separate polar or non-polar compounds.
	WelFlash™ NH ₂	20-40 40-70	120	480	Can be used for compounds containing-OH,-NH or -SH group by hydrogen bonding.
	WelFlash™ Hilic	20-40 40-70	120	480	Polar/Hydrophilic compounds have sufficient retention in HILIC; can be an interesting alternative to RPLC for some types of compounds.
	WelFlash™ SAX	20-40 40-70	120	480	Retains negatively charged compounds.
	WelFlash™ SCX	20-40 40-70	120	480	Useful for compounds with cationic and basic characteristics.
	WelFlash™ Alumina-N	-	-	-	Neutral polar alumina sorbent (pH 6.5) widely used in the sample separation of aldehydes, ketones, quinones, and some glycosides.
Inorganic absorption (aluminium oxide)	WelFlash™ Alumina-B	-	-	-	Basic alumina sorbent (pH 8.5). Ideal for the separation of hydrocarbons, removal of oxy-compounds from hydrocarbons.
	WelFlash™ Alumina-A	-	-	-	Slightly acidic alumina sorbent (pH 4.5). Ideal for the separation of natural and synthetic acidic pigments, acids, and aldehydes.

Excellent Packing Technique

Fig.A: WelFlash Column(12 g)

Fig.B: Flash Column(12 g) of company S

Comparing WelFlash™ Column with S company's flash column at the same chromatographic conditions, one can find that WelFlash achieves baseline separation in shorter time.

Optimize Method to Achieve Faster Separation

After method optimization, one can achieve increased adsorption and elution capacity, better peak shape, and smaller half width of main peaks, and therefore save time in sample data collection.

WelFlash Dimensions

The easiest way to shorten separation time is to use short column and high flow rate. But since short column length leads to decreased column efficiency, we recommend column length between 10-75 mm, which is the best proportion after optimization to ensure largest sample loading and best separation efficiency.

WelFlash dimension: 4 g, 12 g, 25 g, 40 g, 80 g, 120 g, 220 g and 330 g.

WelFlash Column Compatibility

- 1) Luer-lok™ import and Luer™ export, good compatibility with most systems, such as Isco®, Biotage®, and Armen®
- 2) PP column tube and adapter; can tolerate the pressure of regular systems.

Strict Products Quality Testing Process

1) Pressure Tolerance

2) Performance Test (good peak shape and separation performance)

Applications

Comparison of Spherical Silica and Amorphous Spherical Silica

Fig. 1 WelFlash Column: 4 g Spherical Silica (20-40 µm)

WelFlash Column: 4 g Amorphous Silica (40-63 µm)

Fig. 2 WelFlash Column: 40 g Spherical Silica (20-40 µm)

WelFlash Column: 40 g Amorphous Silica (40-63 µm)

Under same conditions, 4 g Spherical WelFlash column can get baseline separation in a short time, but amorphous WelFalsh cannot. When compared to 40 g amorphous silica column, 40 g spherical WelFlash column shows better performance.

Welchrom® Series GC Packed Column

Stationary phase:

OV-1, OV-17, OV-101, OV-225, SE-30, SE-52, SE-54, PRG-400, PEG-600, PEG-1500, PEG-4000, PEG-6000, PEG-20M, DEGS, EGA, EGS, QF-1, FFAP, DNP, β - Diethoxyacetonitrile, silicone oil, apiezon, squalane, DC series and etc.

Supporter:

Aliatomite(Chrosorb series and others), organic support

Adsorbent and polymer microsphere:

Porapak series, Proasil series, GDX series, HDG series, SD series, molecular sieve, carbon molecular sieve, graphitized carbon black, silica gel, aluminium oxide, etc.

Specification:

Inner diameter 2-4 mm, length: 0.5-9 m.

Welch also offers custom-made GC packed columns. Please provide GC model number, column tube type, stationary phase composition, type and particle size of the solid support, inner diameter and length, and the targeted samples.

GC Packed Column Ordering Information

1. Packed Column Specification

Materials	3 mm(OD), 2 mm(ID)	4 mm(OD), 3 mm(ID)	1/8(OD), 2.0 mm(ID)	1/16(OD), 1.0 mm(ID)
Stainless Steel				
Passivated stainless steel				
Glass				
PP				

2. Materials

Support: (such as Chromosorb WAW DMCS)	Mesh Number:
Stationary Phase A: Coated Amount: %	Stationary Phase B: Coated Amount: %

3. Instrument Model

(Such as HP 5890/6890)	

4. Dimension

Length:	OD:	ID:	For glass column, ID is required

Note: for glass column, ID and the center distance between injector and detector are required.

Packing Materials

—Best ingredients and patented technique to produce high quality packing materials

- Higher mechanical strength than competing analytical column packing materials
- Ultra-pure (purity > 99.999% SiO₂) spherical, and totally porous silica
- Proper particle size and narrow size distribution, and larger mass loading

Loading times and pressure

Loading times and column efficiency

Ultra-low metal content

Method: ICP-MS

Items	Result(mg/kg)	LOD(mg/kg)
Na	Not detected	1.0
Mg	Not detected	1.0
Cd	Not detected	1.0

Welch also provides 300 Å packing materials.

Xtimate® Packing Materials

- Wide pH range, perfect peak shape!

Packing Materials	Particle Size (µm)	Pore Size (Å)	Surface Area (m²/g)	Carbon Load (%)	Endcapping	pH Stability
Xtimate® C18	5, 10 µm	120	320 m²/g	14	Yes	1.0-12.5
Xtimate® C8	5, 10 µm	120	320 m²/g	10	Yes	1.0-12.5
Xtimate® Phenyl-Hexyl	5, 10 µm	120	320 m²/g	12	No	1.0-12.5

Amorphous Silica-based Packing Materials

- Welch also provides amorphous silica-based packing materials for you to choose

- Ultra-pure (purity > 99.999% SiO₂) , low metal content.
- Narrow size distribution
- High BET, large sample loading
- 40-63 µm, 35-70 µm and other suitable specifications, can be used for flash and SPE columns.

Welchrom® SPE

Sample preparation is one of the most important steps for the entire analysis process, as over 60% of the process time and over 30% of the analysis errors come from the sample preparation step. Over the last twenty years, SPE has become the most powerful technique for the cleanup, purification, and concentration prior to analytical chromatography of samples from various matrices, including urine, blood, water, beverages, soil, and animal tissue. Solid phase extraction is a form of digital (step-wise) chromatography designed to extract, partition, and/or adsorb one or more components from a liquid phase (sample) onto the stationary phase (sorbent or resin). SPE extends the life time of a chromatographic system, improves qualitative and quantitative analyses, and by changing the original matrix environment of an analyte of interest to a simpler matrix more suitable for subsequent analysis, considerably lessens the demand placed on an analytical instrument.

Use SPE for samples that:

- Contain particulate matter causing system clogging and high back-pressure
- Contain components that cause high background, misleading peaks, and/or poor sensitivity
- Require cleanup, trace enrichment/concentration, or purification
- Require sample matrix or solvent exchange

Benefits of SPE

- Switch sample matrices to forms that are more compatible with chromatographic analyses
- Concentrate analytes for increased sensitivity
- Remove interferences to simplify chromatography and improve quantitation
- Protect analytical column from contaminants

Common SPE Applications

- Pharmaceutical compounds and metabolites in biological fluids
- Drugs of abuse in biological fluids
- Environmental pollutants in drinking and wastewater
- Pesticides and antibiotics in food/agricultural matrices
- Desalting of proteins and peptides
- Fractionation of lipids
- Water and fat soluble vitamins

Comparison Between SPE and HPLC

Items	HPLC	SPE
Tube	Stainless steel tube	Plastic tube
Particle size(μm)	3,5,10	40-300
Shape of particles	Spherical	Amorphous
Column efficiency	20-25,000	<100
Separate theory	Continuous elution	Digital switch elution
Price(\$)	160-650	2-7
Usage mode	Reusable	Disposable
Operate cost	High	Low
Equipment cost	High	Low

Welchrom® Polymeric SPE

Welchrom® Polymeric SPE is made from monodisperse polymer beads, whose surface is modified by Welch's unique surface modification and functionalization technology to produce various types of polymer SPE sorbents. Welchrom® SPE polymer beads have accurate particle size of 40 µm with a high degree of particle size and pore size uniformity, excellent surface area, and optimal bonding density of functional groups, which can meet high sensitivity analysis requirement for a wide variety of applications for acidic, neutral and basic compounds.

1. Welchrom® BRP

- BRP, an abbreviation for "Balanced Reverse Polymer", is modified by Welch's proprietary surface modification technology. It has balanced hydrophobic and hydrophilic adsorbent surface, and is used to separate polar and non-polar substances.
- Equivalent to Oasis HLB from Waters.

Technical Parameters

Matrix	Divinyl Benzene Polymer		
Function Groups	Modified N-Vinylbutyrolactam		
Material Characteristics	Particle Size: 40-60 µm Surface Area: 800-1000 m²/g	Pore Size: 80 Å pH Stability: 1-14	
Retention Mechanism	Reverse Phase		
Applications	Non-polar, polar samples		

Ordering Information

Specification	Packing (pcs /bag)	Part No.
BRP 30 mg/1 ml	100	00522-20015
BRP 60 mg/3 ml	50	00522-20009

BRP 10 g/bottle	/	00522-20017

2. Welchrom® PS/DVB

- A highly cross-linked polystyrene-divinyl benzene copolymer sorbent that allows for rapid adsorption and separation of hydrophobic substances, such as phenols, surfactants, non-B pyridine bromides, antibiotics, amino acids and peptides, etc.
- Ideal for the extraction of polar analytes that are not adequately retained on a C18 or C8 sorbent. The nonselective characteristics of this sorbent is useful for screening applications where a broad range of analytes is to be extracted.
- Equivalent to Agilent's Bond Elute LMS, Bond Elute PPL.

Technical Parameters

Matrix	Divinyl Benzene Polymer		
Function Groups	Polystyrene/ Divinyl Benzene Polymer		
Material Characteristics	Particle Size: 40-60 µm Surface Area: 800-1000 m²/g	Pore Size: 80 Å pH Stability: 1-14	
Retention Mechanism	Reverse Phase		
Applications	Moderate polar, non-polar samples		

Ordering Information

PS/DVB 60 mg/3 ml	50	00526-20009
PS/DVB 150 mg/6 ml	30	00526-20003

3.Welchrom® P-SCX

- Welchrom® P-SCX polymeric resin is a sulfonic acid-modified divinyl benzene polymer with both ion exchange and reverse phase retention properties.
- Allows for complete retention of basic compounds with a pKa between 2-10.
- Ideal solid phase extraction for melamine analysis, excellent retention for both basic and neutral compounds over a wide range of hydrophilicity, including melamine, amphetamine, chlorpheniramine, and phencyclidine.
- Equivalent to Waters' Oasis MCX.

Technical Parameters

Matrix	Divinyl Benzene Polymer		
Function groups	Sulfonic Acid Ligand		
Material Characteristics	Particle Size: 40-60 µm Surface Area: 800-1000 m ² /g	Pore Size: 80 Å pH Stability: 1-14	
Retention Mechanism	Strong Cationic Mechanism		
Applications	Melamine, heterocycle samples with N		

Ordering Information

Specification	Packing (pcs /bag)	Part No.
P-SCX 30 mg/1 ml	100	00523-20015
P-SCX 60 mg/3 ml	50	00523-20016

P-SCX 10 g/bottle	/	00523-20017

4.Welchrom® P-SAX

- Welchrom® Strong Anion Exchange (SAX) polymeric resin is a mixed-mode, tertiary amine-modified divinyl benzene polymer that displays both anion exchange and reversed phase behavior.
- Allows for complete retention of acidic compounds with pKa between 2-8.
- Excellent retention for both acidic and neutral compounds over a wide range of hydrophilicity, typically used for purification of acidic substances, such as tyrosine, estrone, adenine and nucleoside and so on, from alkaline and neutral impurities.

Technical Parameters

Matrix	Divinyl Benzene Polymer		
Function Groups	Quaternary Ammonium Functional Groups		
Material Characteristics	Particle Size: 40-60 µm Surface Area: 800-1000 m ² /g	Pore Size: 80 Å pH Stability: 1-14	
Retention Mechanism	Strong Anion Mechanism		
Applications	Strong acid compounds, such as compound with sulfonic acid group, organic acid etc.		

Ordering Information

Specification	Packing (pcs /bag)	Part No.
P-SAX 30 mg/1 ml	100	00524-20015

P-SAX 500 mg/6 ml	30	00524-20006
P-SAX 10 g/bottle	/	00524-20017

5.Welchrom® P-WCX

- Welchrom® P-WCX resin is a weak cation exchange sorbent that displays both weak cation exchange and non-polar hydrophobic dual function.
- Allows for complete retention of strong basic compounds with a pKa greater than 10.
- Excellent separation of basic compound from acidic and neutral compounds, such as alkaloid, amino acid and clenbuterol, etc.

Technical Parameters

Matrix	Divinyl Benzene Polymer		
Function groups	Carboxylic Acid Ligand		
Material Characteristics	Particle Size: 40-60 µm Surface Area: 800-1000 m ² /g	Pore Size: 80 Å pH Stability: 1-14	
Retention Mechanism	Weak Cationic Mechanism		
Applications	Strong basic compounds, such as compounds that contain quaternary ammonium groups

6.Welchrom® P-WAX

- Welchrom® P-WAX resin is a weak anion exchange sorbent that displays both weak anion exchange and non-polar hydrophobic dual function.
- Allows for complete retention of strong acidic compounds with a pKa less than 1.
- Excellent separation of acidic compound from basic and neutral compounds, such as phosphate tyrosine, estrone, adenine and nucleoside, etc.

Technical Parameters

Matrix	Divinyl Benzene Polymer		
Function Groups Carboxylic Acid Ligand			
Material Characteristics	Particle Size: 40-60 μm	Pore Size: 80 Å

Welchrom® QuEChERS

--- A Simplified Method of Sample Preparation for Pesticide Analysis

What is QuEChERS?

QuEChERS (pronounced "catchers") stands for Quick, Easy, Cheap, Effective, Rugged and Safe—the qualities that describe this sample preparation method for food substances. The technique is quite simple, involving a minimum of steps, and is effective for the cleanup of complex samples.

QuEChERS is an upgraded version of SPE. They have similar functions, but the preparation method of QuEChERS is much easier. With QuEChERS, you can prepare your samples for multi-class, multi-residue analysis while saving time and money. In the United States, the Association of Official Analytical Chemists (AOAC) has published its 2007.01 Method while the European equivalent, the EN 15662 2007, uses similar methodology.

Why Welchrom® QuEChERS?

- Saving time and money for your sample preparation
- High quality, best reproducibility
- Excellent accuracy and reproducibility
- Lower impurity from internal sources by packing with Welchrom® SPE packing materials, and use aluminum foil packing to prevent contamination from external sources
- Lower cost as compared to other brands.

How Does Welchrom® QuEChERS Work?

QuEChERS extraction method is designed for multi-residue pesticide analysis of fruits and vegetables with high water content (80%-95%). Some compounds will interfere with the detection of target pesticide, such as chlorophyll, fatty acid, pigment. These compounds can be removed by QuEChERS.

Some QuEChERS methods add buffers during the extraction step. Two most common methods are the European Committee for Standardization (CEN 15662) method that applies citrate buffer for extraction and the Association of Analytical Communities (AOAC 2007.01) method that uses acetic acid buffer.

For low-water content fruits and vegetables, additional water needs to be added to optimize the extraction. For fruits and vegetables of high-fatty content, C18E should be added to remove it. For fruits and vegetables of high-pigment content, graphicarb should be added.

Welchrom® QuEChERS Workflow

Step 1: Extraction

Transfer homogenized sample (10 g or 15 g) to a 50 ml tube; then add extraction solvent and salt; shake for one minute, and then centrifuge > 1500 rcf for 1 minute.

Welchrom® QuEChERS Extraction Kits:

- 50 ml tubes
- Pre-packaged MgSO₄, NaCl or other salts

Welchrom® QuEChERS Extraction Kits Ordering Information (without 50 ml tubes)

		Pack Size	Part Numbers
AOAC 2007.01	6 g MgSO ₄ , 1.5 g NaAC	100	00528-00000
EN 15662	4 g MgSO ₄ , 1 g NaCl, 1 g NaCitrate, 0.5 g disodium citrate sesquihydrate	100	00529-00000
Original	4 g MgSO ₄ , 1 g NaCl	100	00530-00000

Step 2: Clean up

Choose a right clean up tube; transfer the extracted sample in Step 1 to the clean-up tube; shake for 30 seconds, then centrifuge > 1500 rcf for 1 minute.

Welch Column Can Substitute

Ultisil XB-C18 can substitute:

Symmetry C18	Symmetry shield RP C18	
Luna C18	Luna C18[2]	Discovery C18
Hypersil BDS C18	Alltima C18	Zobax Eclipse C18
BetaBasic C18	Platinum EPS C18	Betasil C18
Inertsil ODS-2	Inertsil ODS-3	Supelcosil LC-18-DB
Kromasil 100A C18	HyPURITY C18	

Ultisil AQ-C18 can substitute:

Aquasil C18	Atlantis C18
Zorbax SB-AQ C18	Synergi Hydro-RP C18
HydroBond PS C18	HydroBond AQ C18
Ultra Aqueous C18	Prontosil C18 AQ
YMC-Pack ODS-AQ	Elite Sino Chrom ODS-BP

Ultisil XB-C8 can substitute:

Symmetry C8	Luna C8	Luna C8[2]
Discovery C8	Hypersil BDS C8	Alltima C8
Zorbax Eclipse XDB C8	BetaBasic C8	Platinum EPS C8
Betasil C8	Inertsil C8	Inertsil C8-3
Supercosil LC-8-DB	Kromasil 100A C8	HyPURITY C8
YMC-Pack C8-AM	Adsorbosphere HS C8	Develosil C8
Cosmosil C8-MS	Nucleosil 100 C8 HD	

Other Ultisil Columns: XB-CN, XB-Phenyl, XB-CN, SiO₂ and Polar RP can replace the most of the same type columns of other brands.

Xtimate® (wide pH range) can substitute:

Waters	Xterra series
	Xbridge series
Agilent	Extend series
Phenomenex	Gemini series

Chiral Column Reference Table

Company	Brand	Coated Normal Phase				Coated Reversed Phase			
		Cellu-D	Cellu-J	Amy-D	Amy-S	Cellu-D/R	Cellu-J/R	Amy-D/R	Amy-S/R
Welch	Ultisil								
Daicel	Chiralcel	OD-H	OJ-H			OD-RH	OJ-RH		
	Chiraldak			AD-H	AS-H			AS-RH	AS-RH
